Sequence 213004, Application US/10424599

Publication No. US20040031072A1

GENERAL INFORMATION:
APPLICANT: LA Rosa Thomas J

APPLICANT: Kovalic David K

APPLICANT: Cao Yongwei

TITLE OF INVENTION: Soy Nucleic Acid Molecules and Other Molecules Associated With
TITLE OF INVENTION: Plants and Uses Thereof for Plant Improvement
FILE REFERENCE: 38-21532231B
CURRENT APPLICATION NUMBER: US/10/424,599
CURRENT FILING DATE: 2003-04-28
NUMBER OF SEQ ID NOS: 285684
SEQ ID NO 213004
LENGTH: 124
TYPE: PRT
ORGANISM: Glycine max
FEATURE:
FORMATION: Clone ID: PAT_MRT3847_34368C.1.pep

                                                                                                                                                                                                                                                                                                                         TISSUE-Seed;
Jin U.-H., Chung C.-H.;
"Characterization and functional analysis of a myo-inositol
"Characterization and functional phosphate synthase cDNA from sesame (Sesamum indicum L.) set
Submitted (JUL-2000) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: D-glucose 6-phosphate = 1D-myo-inosi
phosphate.
-!- COPACTOR: NAD (By similarity).

COFACTOR: NAD.
COFACTOR: Inositol biosynthesis.
PATHWAY: Inositol biosynthesis.
SUBCELLULAR LOCATION: Cytoplasmic (Potential).
INDUCTION: By abscisic acid (ABA).
SIMILARITY: Belongs to the myo-inositol-1-phosphate

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

Arabidops

The invention relates to a nucleic acid fragment encoding a soybean myoinositol 1-phosphate synthase or a mutant myoinositol 1-phosphate synthase having a decreased capacity for the synthesis of myoinositol 1-

Claim 9; SEQ ID NO 12; 48pp; English.

New nucleic acid fragment encoding myo-inositol 1-phosphate synthase, useful for producing plants with decreased raffinose, stachyose, and phytic acid and increased sucrose, leading to valuable and useful soybean products.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC phosphate. The invention also relates to a chimeric gene operably linked CC to suitable regulatory sequences, where expression of the chimeric gene CC results in a decrease in expression of an endogenous or native gene CC encoding a soybean myo-inositol 1-phosphate synthase, a soybean plant CC encoding a soybean plant, a method of making the soybean plant, a CC seed of the soybean seeds, a method of making the soybean plant, a CC processing of soybean seeds, a method of making or producing a soy CC protein product and a method of using a soybean plant homozygous for at CC least one gene encoding a mutant myo-inositol 1-phosphate ynthase having CC decreased capacity for the synthesis of myo-inositol 1-phosphate with CC creased raffinose, stachyose and phytic acid content and increased CC sucrose and inorganic phosphate content, leading to valuable and useful CC soybean products. This sequence represents a mutant soybean myo-inositol CC 1-phosphate synthase polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

```
CC The invention relates to an isolated nucleic acid fragment encoding a copybean myo-inositol 1-phosphate synthase, or a mutant myo-inositol 1-cc phosphate synthase having decreasing capacity for the synthasis for myo-inositol-1-phosphate. Also included are a chimeric gene (comprising the cultivation of the comprising the complement, subfragment or the complement of the synthase, its complement of subfragment or the complement of the subfragment complement of the subfragment or native gene encoding a soybean myo-inositol 1-phosphate synthase, its comprising the chimeric gene results in a decrease in expression of an endogenous or native gene encoding a soybean myo-inositol 1-phosphate synthase), a soybean plant comprising the chimeric gene (with a heritable phenotype of a seed phytic acid content of less than 17 micromol/g, as seed content of raffinose plus stachyose of less than 17 micromol/g, and a seed content of greater than 200 micromol/g, provided that the plant is not LR33), seeds from the plant, making a soybean plant with the heritable phenotype (comprising crossing LR33 or the plant comprising the chimeric gene with a elite soybean plant and selecting a progeny plant of the cross of crossing step that has a heritable phenotype as mentioned above), seeds of soybean plant made by the above method, a soy protein product derived from seeds of a soybean plant (homozygous for one or more gene encoding a mutant myo-inositol 1-phosphate, where the gene confers a charitable phenotype as mentioned above), and making or product or product derived a seritable phenotype as mentioned above), and making or product o

                                                                                                     Matches
                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                     heritable phenotype as mentioned above), and making or producing a soybean protein product derived from seeds of a soybean plant with heritable phenotype as mentioned above. The nucleic acid is useful for altering raffinose saccharide, sucrose, phytic acid and inorganic phosphate content of soybean seeds thus leading to valuable and useful soybean products, since the presence of high concentration of raffinose oligosaccharides in soy plants (and other legumes) can lead to flatulence when consumed by humans. The present sequence represents a mutant myo-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Misc-difference

The invention relates to a nucleic acid fragment encoding a soybean myo-
CC inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate
CC synthase having a decreased capacity for the synthesis of myo-inositol 1-
CC phosphate. The invention also relates to a chimeric gene operably linked
CC to suitable regulatory sequences, where expression of the chimeric gene
CC encoding a soybean myo-inositol 1-phosphate synthase, a soybean plant
CC comprising the chimeric gene, a method of making the soybean plant, a
CC seed of the soybean seeds, a method of making the soybean plant, a
CC secsing of soybean seeds, a method of making the soybean plant, a
CC processing of soybean seeds, a method of making or producing a soy
CC protein product and a method of using a soybean plant homozygous for at
CC least one gene encoding a mutant myo-inositol 1-phosphate synthase having
CC currossed capacity for the synthesis of myo-inositol 1-phosphate with
CC decreased raffinose, stachyose and phytic acid content and increased
CC sucrose and inorganic phosphate content, leading to valuable and useful
CC soybean products. This sequence represents a mutant soybean myo-inositol
CC 1-phosphate synthase polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8; SEQ

                                                   Ş
                                                                                     밁
                                                                                                                                                                                                                                                                                              The invention relates to a nucleic acid fragment encoding a soybean myo-
CC inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate
CC synthase having a decreased capacity for the synthasis of myo-inositol 1-
CC phosphate. The invention also relates to a chimeric gene operably linked
CC to suitable regulatory sequences, where expression of the chimeric gene
CC encoding a soybean myo-inositol 1-phosphate synthase, a soybean plant
CC comprising the chimeric gene, a method of making the soybean plant, a
CC seed of the soybean plant, a soy protein product derived from the
CC processing of soybean seads, a method of making or producing a soy
CC protein product and a method of using a soybean plant homozygous for at
CC decreased capacity for the synthesis of myo-inositol 1-phosphate synthase having
CC decreased raffinose, stachyose and phytic acid content and increased
CC sucrose and inorganic phosphate content, leading to valuable and useful
CC soybean products. This sequence represents a wild type soybean myo-
CC inositol 1-phosphate synthase polypeptide of the invention.
